

# HYBRID INSTALLATION

## Sixth Floor - Plan view diagram

The left plan view shows the (RCN) controller A with its network of wireless detectors. A relay WRS allows more distant IDs a reliable communication with their RCN.

The right plan view shows the (RCN) controller B with its network of wireless detectors. A relay WRS allows more distant IDs a reliable communication with their RCN.

A building can be divided in many independent wireless networks, having each their RCN which supervise their own matched wireless modules.

To avoid interference created by concrete floors, stell structures and elevators, every RCN is harwired linked to the control panel with a network cable.
